

# The FAIRE pavilion

In 2019, we plan to build an experimental pavilion in order to observe our living façade research within a full-scale test.

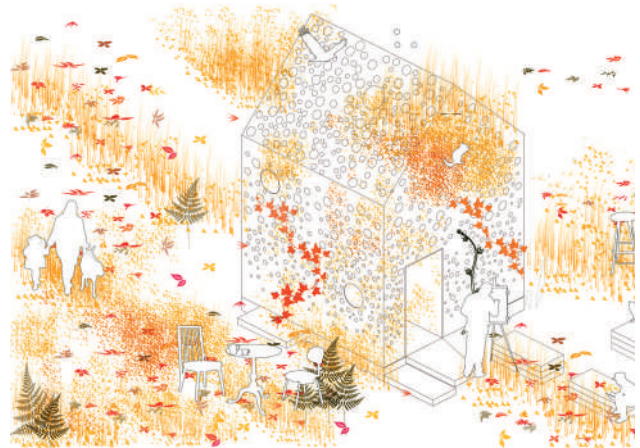

We are considering different possible urban locations where the pavilion's façade could develop long enough for us to observe the evolutions of the cladding material along the gradual apparition of fauna and flora.

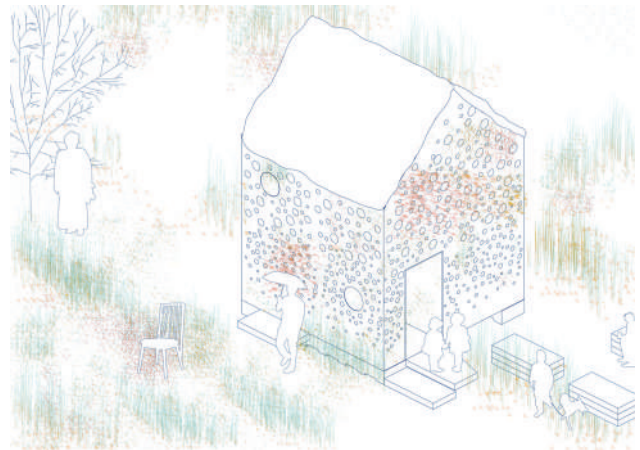

The FAIRE pavilion

Summer

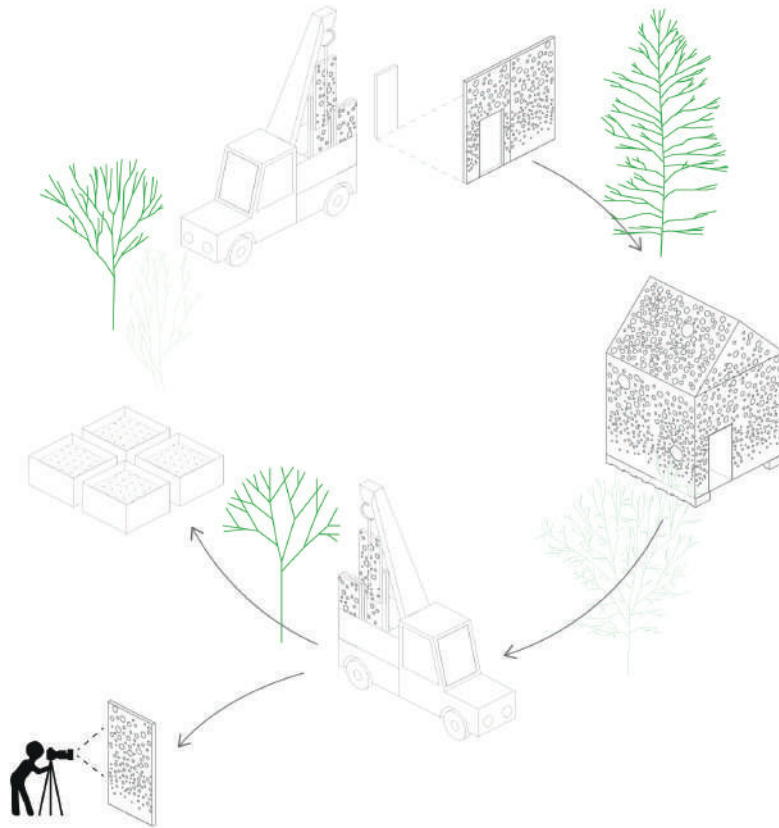

Autumn

Winter

Spring

We consider this pavilion as both a research tool and an observation site. It will consist of pre-fabricated concrete elements, making its assembly and disassembly easy and fast. The construction will not have any significant impact upon its environment. On the opposite photograph, our first prototypes.
